ABSTRACT:

PROBLEM TO BE SOLVED: To enable reservation recording of a desired music for the unit of one piece of music by distribution a data stream containing a program list and a broadcast alarm signal while multiplexing it on program data, and sending the ID of a certain music and a start signal as an alarm signal before broadcasting that music.

SOLUTION: A data stream 100 is composed of a program list 101 and an alarm signal 102, which is inserted into this data stream 100 at any suitable time point, and distributed being multiplexed on program data 200. The program list 101 is the list of the music scheduled to be broadcaster in music programs during a prescribed period including other channels as well. The broadcast alarm signal 102 is sent out before the broadcast of the music part 202 in the program data 200 synchronously with its broadcasting timing. This broadcast alarm signal 102 contains an ID 103 of the music to be broadcaster later, broadcasting time 104 of this music, and start signal 105 to be sent out just before broadcasting the music.
